Testing the Auto-Categorization Scenario

Ticket created with 'Projector not turning on': end-to-end test

1. What is being tested?

This is the main **end-to-end test** of the ticket automation. A ticket is created with only a caller and a short description. The solution should then **automatically fill the Category and Subcategory** by reading the short description, and **send an email to the caller**. If all three happen, the automation works as designed.

2. Test steps

Step	Action	Why
1	Open a new ticket (Incident) form and enter one **Caller** name.	The caller is the person who receives the email, so choose a caller with a valid email ID.
2	Enter the **Short Description**: *Projector not turning on*.	The automation reads keywords from this text (here, 'projector').
3	Click **Save**.	Saving triggers the automation (business rule or flow).
4	**Reload** the form.	The values are set after the save, so reloading shows the updated fields.
5	Check the auto-filled fields.	Confirms the categorization worked.
6	Check that an email was sent to the caller's mail ID.	Confirms the notification worked.

3. Expected results

Field / Action	Expected result
Category	**Hardware** (filled automatically)
Subcategory	**Projector** (filled automatically)
Email	Sent to the **caller's email address**

4. How it works behind the scenes

- When the ticket is saved, a **business rule or flow** checks the short description for keywords such as 'projector'.
- If the keyword matches, the rule sets **Category = Hardware** and **Subcategory = Projector** on the record.
- The update (or ticket creation) also fires an **email notification** to the caller.
- The form on screen was loaded before these values were set, so a **reload** is needed to see them.

5. How to verify the email

Go to **All menus** → **Emails** (under System Logs), search using the email subject, open the record and use **Preview Mail** under Related Links. Confirm the recipient is the caller's mail ID and that the ticket details in the body are correct.

6. Test case record

ID	Scenario	Expected result	Status
TC01	Create ticket with short description 'Projector not turning on', save and reload	Category = Hardware, Subcategory = Projector	Pass / Fail
TC02	Check the email log for that ticket	Email sent to the caller's mail ID with correct content	Pass / Fail

7. Extra tests worth trying

- A short description with different words (for example, 'Projector is not working') to check keyword matching.
- A short description that matches no keyword, to confirm nothing wrong gets filled in.
- A caller with no email ID, to see how the solution behaves.
- Capital and small letters (for example, 'PROJECTOR'), to check the match is not case sensitive.
- The same ticket updated again, to make sure duplicate emails are not sent.

Summary: Create a ticket with the caller and the short description 'Projector not turning on', then save and reload. Category should become Hardware, Subcategory should become Projector, and an email should reach the caller. This proves the automation works from start to finish.
