Checking Email Notifications in ServiceNow

How to verify that the automation sent the right email

1. Why check email notifications?

In the ticket automation, emails are sent to users when events happen (for example, ticket creation, assignment or closure). During testing, you must confirm that the **email was generated**, that it has the **correct subject, recipient and content**, and that it was sent at the **right time**. ServiceNow stores every email in the **Emails** log, so you can check it there without opening a real mailbox.

2. Steps to check

Step	Action	Purpose
1	Go to **All menus** and search for **Emails**.	Finds the email log module.
2	Under **System Logs**, select **Emails**.	Opens the list of all emails sent and received by the instance.
3	Search using the **given Subject name**.	Filters the list to the email you want to verify.
4	Open that record.	Shows the email details (recipients, subject, body, type).
5	Under **Related Links**, click **Preview Mail**.	Displays the email exactly as the recipient would see it.

3. What to verify in the email record

Item	What to check
Subject	Matches the expected subject, with correct ticket number or values filled in.
Recipients (To / CC)	Goes to the correct users or groups, and not to unauthorized users.
Body content	Ticket details, links and dynamic values appear correctly, with no blank or wrong data.
Type / status	Shows the email was sent successfully. A failed or stuck status means something needs fixing.
Timing	Created at the expected moment, after the triggering event.
Duplicates	Only one email per event, unless more are intended.

4. If the email is not found

- Check that the **Notification** record is active, and that its trigger condition matches your test ticket.
- Confirm the ticket meets the condition (state, priority, category and so on).
- Check that recipients have a valid email address and that notifications are enabled for them.
- Look at the system logs and the flow or business rule execution for errors.

- Retest after fixing, and record the result.

5. Add to the test report

ID	Scenario	Expected result	Status
EN01	Create ticket and search email by subject	Email record found in Emails log	Pass / Fail
EN02	Open record and use Preview Mail	Subject, recipient and body are correct	Pass / Fail
EN03	Update ticket state (assignment or closure)	Matching notification generated	Pass / Fail

Summary: Search the Emails log by subject, open the record, and use Preview Mail to confirm the notification has the right recipient, subject and content. This proves the email part of the automation works.
