Building the Auto Classify Flow

ServiceNow Flow Designer: Auto Classify School IT Tickets

1. What are we building?

A **Flow** in Flow Designer is a no-code automation. This flow runs whenever a new ticket is created with an **empty Category**. It reads the **Short Description**, decides what type of problem it is, fills the **Category** and **Subcategory**, and then **emails the caller**. This is the automation that the earlier test scenario (Projector not turning on) checks.

2. Flow at a glance

If short description contains	Category	Subcategory
Wi-Fi **or** Network	Network	Wi-Fi
Projector	Hardware	Projector
Forgot password	Access	Forgot Password
Slow Computer	Performance	Slow computer
(After any of the above)	Send email to the caller	

3. Activity 1: Create the flow

Item	Steps / Value
Open Flow Designer	All menus → search **Flow Designer** → under **Process Automation**, open Flow Designer.
Create	Top right corner: click **New** → select **Flow**.
Name	**Auto Classify School IT Tickets**
Application	**Global**
Next	Click **Build Flow**.

4. Activity 2: Trigger configuration

Item	Value
Trigger	**Record Created**
Table	**Incident** (the incident table used for this project)
Condition	**Category** is **empty**
Finish	Click **Done**.

Why: the flow starts only for new tickets with no category, so already-categorized tickets are left alone.

5. Activity 3: Wi-Fi issue classification

- Under **Actions**, select **Flow Logic** and choose **If**.
- Condition label: **SD is Wifi or Network** (any label you like).
- Condition 1: use the data pill picker, choose **Short description**, operator **Contains**, value **Wi-Fi**.
- Condition 2: **Short description Contains Network**.
- Join the two conditions with **OR**, so either word triggers this branch. Click **Done**.
- Inside the If, click **Action** and choose **Update Record**.
- In the Record field, drag the trigger record from the data pill picker on the right. The Table fills in automatically as Incident.
- Fields: set **Category = Network** and **Subcategory = Wi-Fi**. Click **Done**.

6. Activity 4: Projector issue classification

- Select **Else If** from Flow Logic.
- Condition label: **SD is Projector or Hardware**.
- Condition: **Short description Contains Projector**. Click **Done**.
- Action: **Update Record** with **Category = Hardware** and **Subcategory = Projector**. Click **Done**.

Important: your notes wrote the value as *Prajector*. If the flow uses that spelling, a ticket saying 'Projector not turning on' will **not match** and the test will fail. Use **Projector** in the condition.

7. Activity 5: Password issue classification

- Select another **Else If**.
- Condition label: **SD is Forgot password**.
- Condition: **Short description Contains Forgot password**. Click **Done**.
- Action: **Update Record** with **Category = Access** and **Subcategory = Forgot Password**. Click **Done**.

8. Activity 6: Slow computer classification

- Select another **Else If**.
- Condition label: **SD is Performance**.
- Condition: **Short description Contains Slow Computer**. Click **Done**.
- Action: **Update Record** with **Category = Performance** and **Subcategory = Slow computer**. Click **Done**.

9. Activity 7: Email action and activation

Item	Value
Action	**Send Email** (placed after the classification branches, so it runs once for every ticket)
To	**Caller** → **Email** (use the data pill for the ticket's Caller, then its Email field)
Subject	**Your Request for the issue has been submitted**
Body	A ticket confirmation message, for example: the ticket number and short description with a note that the request is received.
Finish	Click **Done**, then click **Activate** at the top right corner.

The flow only works after it is **Activated**. A saved but inactive flow will not run.

10. Points to watch

- **Keyword spelling:** the flow matches the text you type. 'Wi-Fi' will not match 'WiFi', so add extra conditions if users may write it differently.
- **Order matters:** If / Else If checks run top to bottom, and only the first match runs.
- **No match:** if nothing matches, Category stays empty. You can add an **Else** branch (for example, Category = General) if needed.
- **Reload the form** after saving a test ticket, since the flow updates the record after it is saved.
- **Caller email:** the caller must have a valid email address, otherwise the email cannot be sent.
- **Verify:** check the flow run in Flow Designer's **Executions**, and the email in **Emails** log with Preview Mail.

11. Testing the flow

Short description entered	Expected Category / Subcategory
Wi-Fi not connecting / Network is down	Network / Wi-Fi
Projector not turning on	Hardware / Projector
Forgot password for school portal	Access / Forgot Password
Slow Computer in lab	Performance / Slow computer
(All cases)	Email received by the caller

Summary: The flow triggers on new tickets with an empty category, checks the short description for Wi-Fi/Network, Projector, Forgot password or Slow Computer, updates Category and Subcategory, then emails the caller. Activate it to make it live.
